

Architecture and Data Flow Diagram

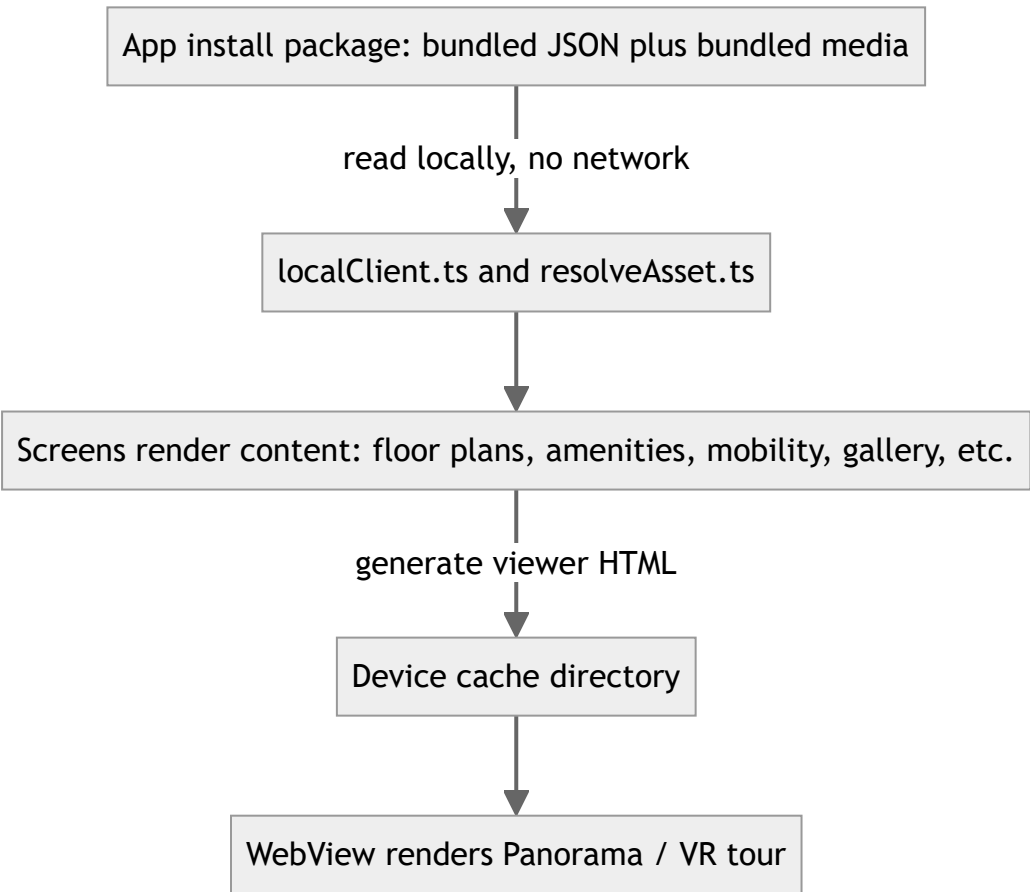

KRPUNE Native, Visual Reference

Project Name	KRPUNE Native (krpune-native)	Date	16 July 2026
--------------	-------------------------------	------	--------------

Component Diagram

Data Flow Diagram

What This Shows

- The application has no backend server or API of its own, and makes no network calls at all during normal use.

- All content, including floor plans, amenities data, mobility and transport information, gallery images, and VR tour video and panoramas, ships bundled inside the installed application package.
- A few source files still contain strings that resemble Cloudinary URLs, left over from the original web application. These are used only as filename keys for local lookup and were confirmed to resolve locally, not over the network.
- No user data is collected, stored, or transmitted. No login, no forms, and no persistent local storage were found in the code.
- The VR and panorama viewer writes a self-generated HTML file into the device's local cache and loads it into an in-app WebView. This stays entirely on-device.

This matches what is documented in the Network Architecture, Data Flow, and Source Code Review reports in this same set. This page provides the same conclusions as a visual diagram.
